Victor Ajibade

Software Engineer · Abuja, Nigeria

ajibadevic@gmail.com +234 812 614 0901 viaxco.com github.com/ViaxCo

I build with care and pay close attention to the little details. For three years I have worked across a fintech web app, its admin app and its API. In my own time I fix everyday problems with small tools and automations.

Experience

Frontend Engineer, Kudy Financials — Jun 2023 – now

- Split one codebase so it builds a separate site for Nigeria (2024) and the US (2025) next to the global site, on AWS S3, CloudFront, ACM and Cloudflare. Built sign-in that carries users between the sites, and wrote the runbook for adding a country.
- Built a shared UI library for the web app and the internal admin app, with typed builds and automatic releases, from v1 in 2024 to v3.6.
- Moved the web app from JavaScript to TypeScript (0% to 100% of files), from Create React App to Vite, and to Tailwind v4 and React 19 while features kept shipping. Moved the public pages to Astro so search engines can read them.
- Work across the web app, admin app and Node.js API: an audit trail for transaction changes, server-side user preferences, payout and tax fixes, and a Telegram exchange-rate bot.
- Run releases, review frontend changes, and trace production issues with Sentry and Datadog.

Contract Engineer, Chasebig Limited — Apr – Jun 2026

- Turn Up, a live nightlife booking app: took over development and fixed and built on Stripe Connect payouts to venues, phone sign-in, and booking and check-in rules, across Flutter, Next.js dashboards and Firebase.
- Eko International Market: built the fulfilment and operations tools: shipment tracking, disputes, admin analytics and exports, stock held during payment, and buyer and vendor messaging.

Freelance — 2024 – now

- Sites and web apps for ADEK Properties, Hadassah Honey Hub, Biba's Treats, Tobey Okafor (edited through a CMS), Emora SmartMatch, a church membership, attendance and giving system, and YRN Beauty, a Lagos makeup studio.

Independent projects — 2021 – 2023

- A shopping app, a news app with comments, an expense tracker and Telegram bots.

Frontend Developer, HASOB Integrated Services — Feb – Jun 2021

- Built the frontend of SCOLA, a school management app, after starting as an intern.

System Planning & Development Engineer, Transmission Company of Nigeria — 2018 – 2020

Projects

Teaching transcripts. Transcribed over 3,000 of my pastor's recorded teachings with MacWhisper, then cleaned and saved them to Google Drive with Gemini File Processor, a batch tool I built.

Self-hosted automation. My own n8n on a VPS with Docker and Traefik, running 22 workflows, including my church's weekly reports over WhatsApp and Telegram.

Mac and browser tools. MicMuteBar and a WhatsApp unread counter, both Swift menu bar apps, and Spotify Notifications, a Chrome extension on the Web Store.

Skills

Languages: TypeScript, JavaScript, Swift, Dart, SQL

Frontend: React, Next.js, Astro, Vite, Tailwind CSS, TanStack Query, Redux

Backend: Node.js, Express, PostgreSQL, Knex, Redis, BullMQ, Firebase, Stripe

Infrastructure: AWS S3 and CloudFront, Cloudflare, Docker, GitHub Actions, n8n

Education

B.Eng. Electrical and Electronics Engineering, Landmark University · First Class Honours — 2019
